The invention relates to human NOVX polypeptides and the polymucleotides encoding them. The invention also relates to antibodies specific to the NOVX polypeptides. The polypeptides, polymucleotides and antibodies are useful for manufacturing a medicament for treating a syndrome associated with a human disease, such as a pathology associated with the NOVX polypeptide. The sequences are useful for disposable, treating or preventing a NOVX-associated disorder, e.g., cancer, atherosclerosis, diabetes, Alzheimer's disease, Parkinson's disease, graft-versus-host disperse, such as the promotory purpura, immunodeficiencies, AIDS, dyslipidemia, obesity, Crohn's disease, bronchial asthma, anorexia, cancer-associated cachexia, multiple sclerosis or fertility. The nucleic acids may be used a shybridisation probes, in chromosome mapping, in tissue typing, in preventive medicine or in pharmacogenomics. This sequence represents a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The present invention relates to plasmid DNA vectors comprising essentially of a replicon and at least one other component selected from promoter. intron, exogenous gene, transcription termination sequence, selectable marker gene, detectable marker gene and an immunostimulatory sequence (ISS) where the non-essential nucleotide sequences have been substantially removed from these vectors. The plasmid DNA vectors are useful in most molecular biology applications, e.g. gene therapy, DNA vaccines, cloning and expression of genes, and in the in vitro production of polypeptides and/or proteins. The present sequence is a commercial plasmid DNA vector pVAXI/Lacz which comprises Cytomegalovirus promoter, the lacz gene, pUC origin of replication and the kanamycin resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAGCGGCCGCTCGAGTCTAGAGGCCCCGTTTAAACCCGCTGATCAGCCCTCGACTGTGCCT 3887

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to fusion protein comprising a nucleotide-binding domain (NBD). A ligand-binding domain (TBD) of an intracellular receptor (ICR) and a transcription regulating domain (TBD). NBD is a polydactyl zinc finger protein (ZPP), or a modular part of it, that interacts fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell carcinoma) and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The fusion protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein and tes DNA are also useful for treating diseases. The fusion protein and can be made to have different selectivity or specificity exogenous or exogenous ligands. The present sequence is BZCLBDAS construct encoding fusion protein comprising SZC zinc finger protein received the sequence ezc, human osebratory is not a function of the sequence ezc, human osebratory is not a function of the sequence ezc, human osebratory is not a function of the sequence ezc, human osebratory is not an analydra and the sequence ezc, human osebratory is not an analydra and the sequence ezc, human osebratory is not an analydra and the sequence ezc, human osebratory is not an analydra and an analydra and an analydra and an analydra and an analydra and an analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra and analydra a

The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (TRD). MBD is a polydactyl zinc finger protein (ZFP), or a modular part of it, that interacts cancer protein functions as a ligand-activated transcriptional regulator. The fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell carcinoma and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The carcinoma and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein and its DNA are also useful for treating diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous ligands. The present sequence is CTLBDAS.

Corrector LBD fragment and vile transactivation domain (TA) from Herpes which is a variant of murine Cys2-His2 ZFP Zif268, human oestrogen creeptor in the ZFP serves as NBD and VP16 TA domain functions as transcription activator. The CTLBDAS construct is based on plasmid companies of the comprises sequences from cytomegalovirus, bacteriophage T7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2227 AAGCGGCCGCTCGAGTCTAGAGGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCT 2286

The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (LBD) of an intracellular receptor zinc finger protein (ZFP), or a modular part of it, that interacts specifically with a contiguous sequence of at least 3 nucleotides. The cusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate correct for a strength of the contiguant cell proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell carcinamia) and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The carcinomal and non-malignant cell proliferative diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be made to have different selectivity or specificity for endogenous or exogenous ligands. The present sequence is EZCLBDBS construct encoding fusion protein comprising EZC zinc finger protein construct encoding fusion protein comprising EZC zinc finger protein construct encoding fusion protein comprising EZC zinc finger protein construct encoding fusion protein comprising EZC zinc finger protein construct as simplex virus. The ZPP serves as NBD and VP16 TA domain functions as creeptor LBD fragment and VP16 transactivation domain functions as companies and simian virus 40 (SV40)
                                                                                                                                                                                                                                     ligand-binding domain; LBD; transcription regulating domain; TRD; zinc finger protein; ZFP; ligand-activated transcriptional regulator; gene regulation; gene therapy; cell proliferative disorder; cancer; psoriasis; pemphigus vulgaris; Behcet's syndrome; lipid histiocytosis; E2C ZFP; human; oestrogen receptor; BR; VPL6; TA; transactivation domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New fusion protein containing nucleotide-binding and ligand-binding domains, useful e.g. in gene therapy of cancer, provides ligand-activated control of gene expression.
                                                                                                                                                                      Plasmid E2CLBDBS encoding fusion protein comprising E2C ZFP-ER LBD-TA.
                                                                                                                                                                                                                 Plasmid E2CLBDBS; fusion protein; nucleotide-binding domain; NBD;

NBD is a polydactyl zinc finger protein (ETP), or a modular part of it, that interacts specifically with a contiguous sequence of at least 3 nucleotides. The fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New fusion protein containing nucleotide-binding and ligand-binding domains, useful e.g. in gene therapy of cancer, provides ligand-activated control of gene expression.
                                                                                                                                                                                                                      9

proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell carcinoma) and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The fusion protein and its DNA are also useful for treating diseases caused that its protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous), and can be made to have different selectivity or specificity construct encoding fusion protein comprising C7 zinc finger protein (ZPP) which is a variant of murine Cyp2-His2 ZFP Zif268, human ocestrogen receptor LBD fragment and VP16 transactivation domain (TA) from Herpes camplex virus. The ZFP serves as NBD and VP16 TA domain functions as transcription activator. The C7LBDBS construct is based on plasmid the comprises and expense of the comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprise and comprises and comprises and comprises and comprise and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprises and comprise and comprises and comprises and comprises and comprises and comprises and comprise and comprises and comprises and comprise and comprises and comprise and comprises and comprise and comprises and comprise and comprises and comprise and comprise and comprises and comprise and comprise and comprise and comprise and comprise and comprise and comprise and comprise and comprise and comprise and comprise and comprise and compris

```
The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (TRD). NBD is a polydactyl zinc finger protein (ZPP), or a modular part of it, that interacts specifically with a contiguous sequence of at least 3 nucleotides. The fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell carcinoma) and non-malignant cell proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell carcinoma) and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The tusion protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous ligands. The present sequence is C7LBDBSG400V construct encoding fusion protein comprising C7 zinc finger protein (ZFP) which is a variant of murine Cyg2-His2 ZFP Zif268, human oestrogen receptor LBD fragment containing G400V mutation and Herpes simplex virus can plannid and plants of the containing G400V mutation and Herpes simplex virus or mularmid and plants. The C7LBDBSG400V construct is based can plannid and plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2299 AAGCGGCCGCTCGAGTCTAGAGGGCCCGTTTAAACCCGCTGATCAGCCTCGACTGTGCCT 2358
                                                 New fusion protein containing nucleotide-binding and ligand-binding domains, useful e.g. in gene therapy of cancer, provides ligand-activated control of gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 AAGCGGCCGCTCGAGTCTAGAGGGCCCGTTTAAACCCGGCTGATCAGCCTCGACTGTGCCT

Plasmid C7LBDAL; fusion protein; nucleotide-binding domain; NBD;

```
The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (CTCR) and a transcription regulating domain (TRD). NBD is a polydactyl zinc finger protein (ZFP), or a modular part of it, that interacts seed the contiguous sequence of at least 3 nucleotides. The responsive protein and the nucleic acid encoding it, are used to regulate the fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell carcinoma) and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The fusion protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous ligands. The present sequence is C7LBDBSG521R construct encoding fusion protein comprising C7 zinc finger protein (ZFP) which is a variant of murine Cys2-His2 ZFP Zif268, human osetrogen receptor LBD fragment contenting G221R mutation and Herpes simplex virus contentivation domain (TAM) The ZFP serves as NBD and VPDE TA domain
                                                                                                                                                                                                                                                                                                                                                                                                                                domains, useful e.g. in gene therapy of cancer, provides ligand-activated control of gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             functions as transcription activator. The C7LBDBSG521R construct is based on plasmid pCDNA3.1 that comprises sequences from cytomegalovirus,
                                                                                                                                                                                                                                                                                                                                                                                                           fusion protein containing nucleotide-binding and ligand-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprises sequences from cytomegalovirus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 6695 BP; 1553 A; 1763 C; 1736 G; 1643 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New fusion protein containing nucleotide-binding and ligand-binding domains, useful e.g. in gene therapy of cancer, provides ligand-activated control of gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (TBD). NBD is a polydactyl zinc finger protein (ZFP), or a modular part of it, that interacts specifically with a contiguous sequence of at least 3 nucleotides. The fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell carcinoma and non-malignant cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histicoycosis). The fusion protein and its DNA are also useful for treating diseases caused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       construct encoding fusion protein comprising C7 zinc finger protein (ZFP) which is a variant of murine Cys2-His2 ZFP Zif268, human oestrogen receptor LBD fragment and VP16 transactivation domain (TA) from Herpes simplex virus. The ZFP serves as NBD and VP16 TA domain functions as transcription activator. The C7LBDAL construct is based on plasmid pCDNA3.1 that comprises sequences from cytomegalovirus, bacteriophage T7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous), and can be made to have different selectivity or specificity for endogenous or stope is c7LBDAL

The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (TCR) and a transcription regulating domain (TRD). MBD is a polydactyl zinc finger protein (ZFP), or a modular part of it, that interacts specifically with a contiguous sequence of at least 3 nucleotides. The fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell proliferative diseases (e.g. colon cancer, prostate cancer, renal-cell proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The fusion protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous) and can be made to have different selectivity or specificity construct encoding fusion protein comprising C7 zinc finger protein (ZFP) which is a variant of murine Cys2-His2 ZFP Zif268, human osetrogen receptor LBD fragment and VP16 transactivation domain (TA) from Herpes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New fusion protein containing nucleotide-binding and ligand-binding domains, useful e.g. in gene therapy of cancer, provides ligand-activated control of gene expression.
                                                                                                                                                                                                                                                                                   Plasmid C7LBDBL; fusion protein; nucleotide-binding domain; NBD; ligand-binding domain; LBD; transcription regulating domain; TRD; zinc finger protein; ZFP; ligand-activated transcriptional regulator; gene regulation; gene therapy; cell proliferative disorder; cancer; psoriasis; pemphigus vulgaris; Behcet's syndrome; lipid histiocytosis; C7 ZFP; Zif268; murine; human; oestrogen receptor; ER; VPI6; TA; transactivation domain; cyclic; circular; ds.
                                                                                                                                                                                                                                                   Plasmid C7LBDBL encoding fusion protein comprising C7 ZFP-ER LBD-TA.

                                                                                                                                                                                         09
simplex virus. The ZFP serves as NBD and VP16 TA domain functions as transcription activator. The C7LBDBL construct is based on plasmid pCDNA3.1 that comprises sequences from cytomegalovirus, bacteriophage T7 and simian virus 40 (5040)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to fusion protein comprising a nucleotide-binding demain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (TRD). NBD is a polydactyl zinc finger protein (ZFP), or a modular part of it, that interacts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ligand-binding domain; LBD; transcription regulating domain; TRD; zinc finger protein; ZFP; ligand-activated transcriptional regulator; gene regulation; gene therapy; cell proliferative disorder; cancer; psoriasis; pemphigus vulgaris; behcet's syndrome; lipid histiocytosis; 2C7 ZFP; Zif268; murine; human; oestrogen receptor; ER; VPL6; TA; transactivation domain; cyclic; circular; ds.

fusion protein functions as a ligarda-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell proliferative diseases (e.g. psoriasis, proliferative diseases (e.g. psoriasis, pemphigus vulgaris, Behcet's syndrome and lipid histiocytosis). The tusion protein and its DNA are also useful for treating diseases caused by viruses in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous), and can be made to have different selectivity or specificity for endogenous or exogenous ligands. The present sequence is 2C7LBDAS construct encoding fusion protein comprising 2C7 zinc finger protein construct encoding fusion protein comprising 2C7 zinc finger protein receptor LBD fragment and VP16 transactivation domain (TA) from Herpes implex virus. The ZFP serves as NBD and VP16 TA domain functions as transcription activator. The 2C7LBDAS construct is based on plasmid polyna; and simian virus 40 (SV40) specifically with a contiguous sequence of at least 3 nucleotides. The

cdNA library made from mRNA isolated from trabecular
meshwork cells established fom eyes from 6 individuals,
ages 2 weeks to 2 years. Cells were harvested at passages
3 through 6. Invitrogen made a unidirectional cDNA library
from the mRNA from the frozen cells using a pcDNA3 vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EST '08-MAR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  87
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Butheria, Primates, Catarrhini, Hominidae, Homo.

industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S. aureus infection. The polypeptides can also be used in a kit for the immunodetection of S. aureus in a sample. S. aureus is implicated in numerous human diseases, including cellulities, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, acalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer

PAIs are large fragments of DNA which comprise pathogenicity determinants. The sequences of the invention are taken from PAI IV and PAI IV is located at approximately 64 min (near phv) on the E. coli chromosome and is greater than 170 kb. PAI V is located at approximately 94 min (at phR) on the E. coli chromosome and is approximately 94 min (at phR) on the E. coli chromosome and is approximately 160 kb in size. Antibodies specific to the proteins encoded by the PAI open reading frames of the invention can be used in kits to detect uropathogenic E. coli. The proteins are used in vaccines to elicit a protective immune response in an animal to the uropathogenic E. coli

                                                                                                                                                                                                             The plasmid produces secreted beta-urogastrone in a transformed expression system. Similar plasmids may be constructed where the secertion signal may be coupled with eg. somatostatin, insulin, growth hormone, interferon, IL-2, gastric inhibitory peptide, influenza B SA, epidermal growth factor and thymosine-beta4. (Updated on 25-MAR-2003 to correct PA field.)
Recombinant vector for polypeptide secretion - contains signal peptide sequence directly bonded to peptide-coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The peptide may be expressed from plasmid pUGT 150s in a transformed accoli host. The plasmid may carry several separately expressing sequences comprising a tac promoter, SD site, signal peptide, and coding sequence, to produce beta-UG in high yield. ```
An example of a sequence detected by a probe consisting of polyinosine, polydeoxyinosine, oligoinosine and/or oligodeoxyinosine is labeled. The sens and probe are hybridized and the existence of DNA in the product is detected. It can be used to detect the presence of malignant tumour. (Updated on 10-MAR-2003 to add missing OS field.)                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90260). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting the cell division cycle, or capable of inhibiting the cell division cycle, or capable of inhibiting mitosis and/or meiosis. They can also be used in a method for treating a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autoimmune disorders such as (glomerulonephritis and rheumatoid arthritis), dermatological disorders disorders (such as psoriasis), antiinflammatory, antifungal and antiparasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 AGGGTTATTGTCTCATGAGCGGATACATATTTGAATGTATTTAGAAAAATAAACAAATAG
                                                                                                                                                                                                                                                                                  Polynucleotides encoding cell cycle progression proteins, useful for treating a tumor or a proliferative disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ema pallidum infection; syphilis; Borrelia infection; animal; production; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide sequence from the genome of Treponema pallidum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 101; DB 6; Length 466;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AGGGTTATTGTCTCATGAGGGGGGTACATATTTGAATGTATTTAGAAAAATAAACAAATAG 296
                                                              The present invention relates to Drosophila cell cycle progression proteins (AAM47572-AAM47608) and their coding sequences (ABA90366-ABA90520). The coding sequences and proteins are useful for identifying a substance capable of affecting the function of the corresponding gene, a substance capable of inhibiting the cell division cycle, or capable of inhibiting the cell division cycle, or capable of their inhibiting a tumour or proliferative disorder, cardiovascular disorders (such as restenosis and cardiomyopathy), autoimmune disorders such as (glomerulonephritis and rheumatorid arthritis), dermatological disorders (such as psoriasis), antiinflammatory, antifungal and antiparasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short oligonucleotide primers, also known as extendable oligos (Bos), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can amplification for RT-PCR, ligation chain reaction (LCR), rolling circle amplification, strand displacement amplification and isothermal DNA amplification. Accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This polynucleotide sequence is the electropherogram of a DNA sequencing reaction that used the pUCI9 plasmid and B154/T422 oligos, used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and

The invention relates to novel isolated prostate gland related nucleic acids (I) and polypeptides (II). (I) and (II) are useful for diagnosis, prevention, and/or treatment of diseases and/or disorders of the prostate such as acute non-bacterial prostatitis, chronic non-bacterial prostatitis, chronic non-bacterial prostatitis, prostatodystonia, prostatosis, granulomatuus prostatitis, malacoplakia, benign prostatic chronic non-bacterial prostatitis, prostatodystonia, prostatophy or hyperprolasia, and prostatitis, malacoplakia, benign prostatic hypertrophy or hyperprolasia, and prostate neoplastic disorders, including adenocarcinomas, transitional cell carcinomas, ductal carcinomas, and squamous cell carcinomas. (I), (II) and antibody to (II) are useful for diagnosing and treating reproductive system disorders (Ragease), authritis), blood-related disorders (sickle cell anaemia), archinitis), blood-related disorders (sickle cell anaemia), respiratory disorders (musculomephritis), cardiovascular disorders (arrhythmias), respiratory disorders, musculoskeletal system disorders (arrhythmias), respiratory disorders (Alzheimer's disease and Parkinson's disease), endocrine disorders (Addison's disease and Parkinson's disease), condocrine disorders (Addison's disease and Parkinson's disease), condocrine disorders (Addison's disease and Parkinson's disease), condocrine disorders (Alzheimer's diseases at the callular level, and wound healing and epithelial cell proliferation. (I) or (II) is cuseful to prevent skin aging, for preventing hair loss, to maintain organs before transplantation, and as food additive or preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated prostate gland related polypeptide useful for diagnosis and treatment of disorders of prostate such as prostatodystonia, prostatosis, prostatitis, benign prostatic hypertrophy and malacoplakia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps

The invention relates to novel isolated polypeptides (I), and diagnostic polynucleotides (II). (I) and the antibody to (I) are useful for diagnosting, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. congenital and acquired immunodeficiencies, autoimmune contransplant rejections and graft versus host disease, infectious diseases (e.g. transplant rejections and graft versus host disease, infectious diseases (e.g. transplant rejections and graft versus host disease, infectious diseases (e.g. transplant rejections and graft versus host diseases, infectious diseases (e.g. chear blood-related disorders (e.g. disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. Alzheimer's disease, Parkinson's disease), reproductive graft of an endormalities (e.g. Alzheimer's disease, Parkinson's disease), reproductive system disorders (e.g. Addison's epithelial cell proliferation, endocrine disorders (e.g. Addison's epithelial cell proliferation, endocrine disorders (cirrhosis), as stimulators of disease), reproductive system disorders (cirrhosis), as stimulators of mighter affinity antibodies, and as a means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). AAS26976-AAS27850 represent novel signal transduction pathway protein coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 101; DB 4; Length 776; 100.0%; Pred. /lab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
/clone lib="Oxytricha plasmid UUGC10 library."
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (gi|473114|qb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/note="Vector: PWDAJNY: Purified macronuclear chromosomal DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 polymorleocide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWDA2 (gilq732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. Coli XII0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

/clone="Ubector: PWDAJANY, Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymuclecide kinase. Adaptor
oligonuclectides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWD42 (qi|4732114|qb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli Xil0-Gold (Stratagene) cells
and selected for ampicillin resistance."

/clone lib="Coxytricha plasmid UUGC10 library"
/note="Vector: PWD42nv; Purified macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWP42 (gi|4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/clone="Nector: PWB47nv, Purified macronuclear chromosomal DNA from Oxytricha trifallax was blunt end-repaired with T4 DNA polymerase and T4 POAP willo-leotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. Vector DNA was prepared from a derivative of pWM92 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. Coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                               macronuclear chromosomes

/note="Vector: PWD42nv; Purifided macronuclear chromosomal
DNA from Oxytricha trifallax was blunt end-repaired with
T4 DNA polymerase and T4 polymucleotide kinase. Adaptor
oligonucleotides were ligated to the blunt ends in high
molar excess. Vector DNA was prepared from a derivative of
pWM42 (gil4732114|gb|AF129072.1), a copy-number inducible
derivative of plasmid R1. The vector was ligated with
adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. Coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
